EP1/EP2 end post

The eye-catching profile of the artos end post has an excellent stability and ground seating, due to its large surface area in contact with the soil.

With different material thicknesses available, we can offer a personalised solution to each and every request. Years of experience working with harvesting machines confirms the stability of this end post.

The key to the success of this posts is due to the 8 or 10 rounded metal bars that are welded into the post (custom shape). They ensure that the post has an excellent seating in the spoil, as well as a strong resistance to twisting.

The rounded metal bars also enable you to attach wire to the end post. They can be used for chains to fix the wire to the post, or other accessories such as tension springs to secure your foliage wires. At the base of the post the metal bars are welded inclined to help fix the post into the ground, as well as being used as a stopper when a ground base plate is used.

The welded bars on the artos EP2 do not surpass the width of the metal profile of the post.
